Undergraduate Manual of Clinical Cases in Paediatrics - Harish Pemde 2016-08-25

Working up a 'case' for presentation to the examiner is an integral part of clinical learning. Case presentations give opportunity for applying the knowledge of diseases and the clinical skills for evaluation and management of a patient. This practical application (of theory and clinical skills) is tested in practical examination in clinical subjects like paediatrics. This book helps enabling the logical application of theoretical knowledge and clinical skills in real life situations. This book contains details of several real cases, which are common in this part of the world. Each case provides description in a standard format and answers to the questions commonly asked at various stages of case presentation. Important points for communication with parents/patients are given in

every case, which will help in developing communication and counseling skills related to a particular disease or condition. It prepares the reader for other components of practical examination in paediatrics, including x-rays, instruments, laboratory reports, and drugs. Annexure includes almost all charts required for clinical workup of a paediatric patient. Very special feature are case related videos on various topics, MCQs, whiteboard lectures on clinical approach to common conditions. Forensic Pathology of Infancy and Childhood - Kim A. Collins 2014-02-18

The investigation of sudden or unexplained death of children represents a unique medical and forensic area of study. Children have unique anatomic and functional characteristics that must be recognized and understood by the medical investigator. Further complicating this process is the fact that the anatomic structure, composition and function of various organs and organ systems in the pediatric population change throughout the developmental stages of childhood. The disease processes, reactions to trauma and risk factors for accidental death and homicide change from infancy through adolescence. *Forensic Pathology of Infancy and Childhood* provides an authoritative, comprehensive reference text devoted to the medicolegal investigation of sudden unexpected death in children. With contributions from internationally renowned experts, individual chapters focus on specific unique causes and organ systems with detailed accounts of the changes in fatal diseases, risk factors of causes of sudden death, and responses to fatal trauma that occur as a child grows from neonatal stage through infancy, toddlerhood, childhood and adolescence. This text

is an essential reference resource for forensic pathologists, medical examiner offices, pediatric pathologists, pediatric hospitals, anatomic pathologists and those in training as well as those in related legal professions.

Manual of Child Neurology - Mohammed Jan 2012

Since the last century, remarkable advances at both the basic and clinical levels have considerably improved our ability to evaluate and treat children with neurological disorders. Many cases seen by general pediatricians are primarily neurological accounting for up to 30% of all

consultations to pediatrics with a high ratio of follow-up visits to new patients of about 3:1. This manual is a neurology reference for medical students and pediatric residents and is intended to supplement larger textbooks on pediatric neurology already available. Many of undergraduate medical students refer to deficient and oversimplified references that do not enable them to deal with pediatric neurology patients adequately. The manual presents a simplified, organized, and comprehensive problem based approach to common pediatric neurological disorders directed to the level of medical students, pediatric residents, general practitioners and general pediatricians. This e-book is thus a concise outline with practical tips to facilitate proper diagnosis and management of various neurological disorders. -- Publisher.

Neonatal Screening for Inborn Errors of Metabolism - H. Bickel
2012-12-06

Although neonatal screening was begun only 20 years ago, and is consequently still in its early stages, it is already a classic example of efficient preventive pediatrics. At present, routine neonatal screening covering a satisfactory percentage of newborn babies is carried out in only a small part of the world. For some five diseases enough infants have been screened to give reasonably reliable information about the frequency of these diseases in various populations. Interesting differences are beginning to appear in populations of different ethnic and racial background. The medical importance of neonatal screening is especially obvious in metabolic diseases that are not too rare and for which effective treatment depends upon an early diagnosis, such as phenylketonuria, galactosemia, and - a more recent screening program - hypothyroidism. About 1 of 4000 newborns is affected with hypothyroidism and can receive timely substitution with thyroid hormone. Of 34.5 million babies tested for phenylketonuria, 3000 cases have been diagnosed in time to prevent mental retardation by means of dietary therapy.
