Marks' Basic Medical Biochemistry - Alisa Peet 2012-02-01

This core textbook helps medical students bridge the gap between biochemistry, physiology, and clinical care. The strength of Mark's Basic Medical Biochemistry is that it starts with the patient—the metabolic and nutritional needs of the human body (easy for students to understand)—as opposed to explanations of complex chemical theory. Mark's Basic emphasizes clinical correlations throughout the text and links biochemical concepts to physiology and pathophysiology, using patient vignettes as the context. These specific and memorable mock patient cases are followed throughout the chapter to pose questions, illustrate core concepts, and help students remember and apply biochemical principles within the context of clinical practice.

Handbook of Resilience in Children - Sam Goldstein 2012-08-04

Today's children face a multitude of pressures, from the everyday challenges of life to the increasing threats of poverty, exploitation, and trauma. Central to growing up successfully is learning to deal with stress, endure hardships, and thrive despite adversity. Resilience - the ability to cope with and overcome life's difficulties - is a quality that can potentially be nurtured in all young people. The second edition of the *Handbook of Resilience in Children* updates and expands on its original focus of resilience in children who overcome adversity to include its development in those not considered at risk, leading to better outcomes for all children across the lifespan. Expert contributors examine resilience in relation to environmental stressors, as a phenomenon in child and adolescent disorders, and as a means toward positive adaptation into adulthood. New and revised chapters explore strategies for developing resilience in the family, the therapist's office, and the school as well as its nurturance in caregivers and teachers. Topics addressed include: Resilience in maltreated children and adults. Resilience and self-control impairment. Relational resilience in young and adolescent girls. Asset-building as an essential component of treatment. Assessment of social and emotional competencies related to resilience. Building resilience through school bullying prevention programs. Large-scale longitudinal studies on resilience. The second edition of the *Handbook of Resilience in Children* is a must-have reference for researchers, clinicians, allied practitioners and professionals, and graduate students in school and clinical psychology, education, pediatrics, psychiatry, social work, school counseling, and public health.

Homocysteine in Health and Disease - Ralph Carmel 2001-07-19

High levels of homocysteine have been identified as a very important risk factor in cardiovascular disease. Homocysteine-related abnormalities are also thought to contribute to birth defects and dementia, and there are many common acquired diseases, drugs and genetic disorders which adversely affect the metabolism of homocysteine. In this 2001 book a multidisciplinary team of experts in the field give a clear analysis of the biochemistry, genetics, epidemiology, clinical settings, causes, impact and treatment of homocysteine disorders. This is an unusually comprehensive account of the broad range of medical, nutritional and methodological implications of homocysteine in health and disease.

Immunopharmacogenomics - Yusuke Nakamura 2015-09-18

This book proposes immunogenomics, or immunopharmacogenomics, as the next-generation big science to uncover the role that the immune system plays in the pathogenesis of many diseases, by summarizing the importance of the deep sequencing of T-cell and B-cell receptors.

Immunogenomics/immunopharmacogenomics, a genetic characterization of the immune system made possible by next-generation sequencing (NGS), will be important for the further understanding of the pathogenesis of various disease conditions. Abnormal immune responses in the body lead to development of autoimmune diseases and food allergies. Rejection of recipient cells and tissues, as well as severe immune reactions to donor cells, is also the result of uncontrolled immune responses in the recipient body. There have been many reports indicating that activated immune responses caused by the interaction of drugs and HLA are present in drug-induced skin hypersensitivity and liver toxicity. The importance of the host immune responses has been recognized in cancer treatments, not only for immunotherapy but also for cytotoxic agents and molecular targeted drugs. Hence, characterization of the T-cell receptor and B-cell receptor repertoire by means of NGS deep sequencing will ultimately make possible the identification of the molecular mechanisms that underlie various diseases and drug responses. In addition, this approach may contribute to the identification of antigens associated with the onset or progression of autoimmune diseases as well as food allergies. Although the germline alterations and somatic mutations have been extensively analyzed, changes or alterations of the immune responses during the course of various disease conditions or during various treatments have not been analyzed. It is also clear that computational analyses to draw meaningful inferences of functional recognition receptors on the immune cells remain a huge challenge.

Social Isolation and Loneliness in Older Adults - National Academies of Sciences, Engineering, and Medicine 2020-06-14

Social isolation and loneliness are serious yet underappreciated public health risks that affect a significant portion of the older adult population. Approximately one-quarter of community-dwelling Americans aged 65 and older are considered to be socially isolated, and a significant proportion of adults in the United States report feeling lonely. People who are 50 years of age or older are more likely to experience many of the risk factors that can cause or exacerbate social isolation or loneliness, such as living alone, the loss of family or friends, chronic illness, and sensory impairments. Over a life course, social isolation and loneliness may be episodic or chronic, depending upon an individual's circumstances and perceptions. A substantial body of evidence demonstrates that social isolation presents a major risk for premature mortality, comparable to other risk factors such as high blood pressure, smoking, or obesity. As older adults are particularly high-volume and high-frequency users of the health care system, there is an opportunity for health care professionals to identify, prevent, and mitigate the adverse health impacts of social isolation and loneliness in older adults. *Social Isolation and Loneliness in Older Adults* summarizes the evidence base and explores how social isolation and loneliness affect health and quality of life in adults aged 50 and older, particularly among low income, underserved, and vulnerable populations. This report makes recommendations specifically for clinical settings of health care to identify those who suffer the resultant negative health impacts of social isolation and loneliness and target interventions to improve their social conditions. Social

Isolation and Loneliness in Older Adults considers clinical tools and methodologies, better education and training for the health care workforce, and dissemination and implementation that will be important for translating research into practice, especially as the evidence base for effective interventions continues to flourish.

Paleonutrition - Mark Q. Sutton 2010-04-15

Paleonutrition is the analysis of prehistoric human diets and the interpretation of dietary intake in relation to health and nutrition. As a field of study, it addresses prehistoric diets in order to determine the biological and cultural implications for individuals as well as for entire populations, placing archaeological interpretations into an anthropological context. Throughout history, and long before written records, human culture has been constantly in flux. The study of paleonutrition provides valuable insights into shifts and changes in human history, whatever their causes. This is the most comprehensive and up-to-date book on the topic. Intended for students and professionals, it describes the nature of paleonutrition studies, reviews the history of paleonutrition research, discusses methodological issues in the reconstruction of prehistoric diets, presents theoretical frameworks frequently used in paleonutrition research, and showcases examples in which paleonutritional analyses have been successfully conducted on prehistoric individuals, groups, and populations. It offers an integrative approach to understanding state-of-the-art anthropological dietary, health, and nutritional assessments. The most recent and innovative methods used to reconstruct prehistoric diets are discussed, along with the major ways in which paleonutrition data are recovered, analyzed, and interpreted. Paleonutrition includes five contemporary case studies that provide useful models of how to conduct paleonutrition research. Topics range from ancient diets in medieval Nubia to children's health in the prehistoric American Southwest to honey use by an ethnographic group of East African foragers. As well as providing interesting examples of applying paleonutrition techniques, these case studies illustrate the mutually beneficial linkages between ethnography and archaeology.

Drugs Affecting Lipid Metabolism - Rodolfo Paoletti 2012-12-06

The recent symposium and the appearance of this new book on Drugs Affecting Lipid Metabolism take place at a very unusual time for the development of this area. After the publication and wide acceptance of the results of the cholestyramine study by the Lipid Clinics in the USA, showing for the first time a direct association between drug induced reduction of plasma levels of total and LDL cholesterol and coronary heart disease in a high risk population, an unparalleled interest in drugs and other procedures able to control plasma cholesterol levels has been activated. Two other significant events occurred during 1986 and 1987: the availability of compact instruments for the immediate determination of total cholesterol in plasma or total blood and the developments of new agents such as the inhibitors of HMG-CoA (hydroxymethyl glutaryl CoA) reductase and ACAT inhibitors, with potentially great effect on plasma lipid levels after oral administration. These new advances, together with the combined efforts of cell biologists and lipoprotein chemists, have set the pace for an exciting period of research and clinical applications of diets and drugs affecting lipids. This volume, which includes the work of many of the leading world laboratories, represents an authoritative and up-to-date appraisal of the status of the art and a stimulus to future research at laboratory and clinical level in an area of opportunity for clinical and preventive

medicine.
