Mitochondrial Biogenesis

and Breakdown - Valentin Luzikov 2012-03-19

It is a strange fact that many modern cell biochemists have a keen interest in biosynthetic processes, such as protein and nucleic biosynthesis or organelle biogenesis, but tend to regard degradative processes merely as irritating reactions that disrupt the flow of synthetic reactions. Historically, the elucidation of catabolic pathways preceded that of anabolic pathways, so that there is also a tendency to regard work on proteases, phospholipases, nucleases, etc. , as somewhat "old-fashioned. " It is the great contribution of Professor Luzikov's book to show that, at least in the case of mitochondrial research, the separation of studies on anabolic and catabolic processes has been very harmful. In an extremely erudite and measured way, the author carefully develops the argument that we can only understand

mitochondrial biogenesis fully if we take into account the role of degradative processes. The action of lytic enzymes is shown not to be a random affair, but rather a process that is fully integrated into the process of mitochondrial assembly. A second important contribution of this book is the fact that it contains a masterly review of the fundamental literature on mitochondrial structure, function, breakdown and synthesis presented in an integrated and logical manner.

Deep Learning - Ian

Goodfellow 2016-11-10

An introduction to a broad range of topics in deep learning, covering mathematical and conceptual background, deep learning techniques used in industry, and research perspectives.

“Written by three experts in the field, Deep Learning is the only comprehensive book on the subject.” —Elon Musk, cochair of OpenAI;

cofounder and CEO of Tesla and SpaceX Deep learning is a form of machine learning that enables computers to learn from experience and understand the world in terms of a hierarchy of concepts. Because the computer gathers knowledge from experience, there is no need for a human computer operator to formally specify all the knowledge that the computer needs. The hierarchy of concepts allows the computer to learn complicated concepts by building them out of simpler ones; a graph of these hierarchies would be many layers deep. This book introduces a broad range of topics in deep learning. The text offers mathematical and conceptual background, covering relevant concepts in linear algebra, probability theory and information theory, numerical computation, and machine learning. It describes deep learning techniques used by practitioners in industry,

including deep feedforward networks, regularization, optimization algorithms, convolutional networks, sequence modeling, and practical methodology; and it surveys such applications as natural language processing, speech recognition, computer vision, online recommendation systems, bioinformatics, and videogames. Finally, the book offers research perspectives, covering such theoretical topics as linear factor models, autoencoders, representation learning, structured probabilistic models, Monte Carlo methods, the partition function, approximate inference, and deep generative models. Deep Learning can be used by undergraduate or graduate students planning careers in either industry or research, and by software engineers who want to begin using deep learning in their products or platforms. A

website offers supplementary material for both readers and instructors.

The Biology of Death -

André Klarsfeld 2004

Why do we die? Do all living creatures share this fate? Is the body's slow degradation with the passage of time unavoidable, or can the secrets of longevity be unlocked? Over the past two decades, scientists studying the workings of genes and cells have uncovered some of the clues necessary to solve these mysteries. In this fascinating and accessible book, two neurobiologists share the often-surprising findings from that research, including the possibility that aging and natural death may not be forever a certainty for most living beings. André Klarsfeld and Frédéric Revah discuss in detail the latest scientific findings and views on death and longevity. They challenge many popular assumptions, such as the

idea that the death of individual organisms serves to rejuvenate species or that death and sexual reproduction are necessarily linked. Finally, they describe current experimental approaches to postpone natural death in lower organisms as well as in mammals. Are all organisms that survive until late in life condemned to a "natural" death, as a consequence of aging, even if they live in a well-protected, supportive environment? The variability of the adult life span—from a few hours for some insects to more than a millennium for the sequoia and thirteen times that for certain wild berry bushes—challenges the notion that death is unavoidable. Evolutionary theory helps explain why and how some species have achieved biological mechanisms that seemingly allow them to resist time. Death cannot be understood without looking into cells—the essential building blocks of life. Intriguingly, at

the level of cells, death is not always an accident; it is often programmed as an indispensable aspect of life, which benefits the organism as a whole.
